

keymacro is an easy-to-use Windows Installer wizard that creates a macro file which has a list of actions and parameters. It is a simple and easy way to create a macro file. Windows Installer is an application deployment technology designed to handle dependencies and interactions between components. Windows Installer can also be used to patch applications, to repair applications, to uninstall applications, and to do a complete system restore. When you perform a Windows Installer installation, all the installed files are stored in the Windows Installer package database. The package database contains all the files that are required to install a product. To perform an installation, Windows Installer first finds all the files that are required to complete the installation. It then creates the required components and registers them with Windows Installer. After that it performs the installation on the target machine. When you remove the installation, Windows Installer deletes all the components that were created for the installation. After that, all the files in the package database are no longer available for installation. You can also perform an uninstallation to remove all the components and the files that were created for the installation. Windows Installer requires some system configuration in order to install products. First, you must enable the Windows Installer service to start automatically. You also have to install the Windows Installer engine with the installer package that you plan to install. Windows Installer uses a chainer to integrate packages in a transaction with multiple components. So in case not all the packages are successfully installed or you choose to cancel the installation process, Windows Installer can roll back all the changes and restore the operating system to its original state. Keymacro Description: keymacro is an easy-to-use Windows Installer wizard that creates a macro file which has a list of actions and parameters. It is a simple and easy way to create a macro file. Windows Installer is an application deployment technology designed to handle dependencies and interactions between components. Windows Installer can also be used to patch applications, to repair applications, to uninstall applications, and to do a complete system restore. When you perform a Windows Installer installation, all the installed files are stored in the Windows Installer package database. -If the page does not contain the onClick event of the attachment icon, it should be added. -When the onClick event is not present, the user has to click the attachment icon before the macro will execute. -When this macro is clicked, all LB text editors should be opened. -After the first message is entered, all text editors should be closed. -If there are more than one message on the page, the button should be replaced with a Next button, which will move to the next message and open all editors again. -A new message is appended to the end of the list of messages. -A file is saved to the current directory with the name of the current list of messages. -The current list of messages is saved to a text file with the same name as the file. -A previous message is appended to the end of the list of messages. -A previous message is saved to a text file with the same name as the file. -After the file has been saved, a file is deleted from the directory. Version 1.1: -Editing a message opened in the editor will now close the editor. -The application will now give feedback to the user about any errors in macros. -An error was introduced in the onClick() event which prevented the macro from executing. NOTE: It is now possible to use LiteWriter as a script to automate the act of adding onClick events to specific attachments. Use it to quickly copy text from the current post to your clipboard and then paste it to the forums. NOTE: As of version 1.2.1, it has been discovered that using LiteWriter and the onClick event may lead to a crash on forum servers. We are considering a fix. Until then, we advise that if you find LiteWriter is causing a crash on your server, we suggest you disable it using the options menu. EDIT: After a great deal of testing, it is discovered that LiteWriter can cause a security issue when used with certain forum software. Use at your own risk! We cannot guarantee LiteWriter will not cause issues when used with certain forum software. Version 1.3: -To prevent LiteWriter from crashing, the onClick event was changed from _POST_ATTACHMENT_TO_FORUM to _DETACH_ATTACHMENT_TO_FORUM.
