In DE-A-28 05 939, it is described that the high molecular weight polymers or copolymers in the hot melt compositions used for the impregnation of textile material contain long polymer chains which do not melt. In this way, a film-forming mixture is formed which is to be applied to the material to be treated. The presence of a particular solvent leads to a modification of the film-forming mixture of the composition. In DE-C-28 16 779, a film-forming mixture containing a hot melt polymer blend which is suitable for printing on textile material is described. In addition to the above-mentioned textile materials, there are further substrate materials in particular in the form of flexible materials or in the form of glues in connection with which suitable film-forming hot melt compositions are also advantageous. Suitable textile materials are, in particular, wovens, non-wovens, knits or various kinds of artificial and natural fibers, in particular, polyamide fibers, polyester fibers, acrylic fibers, polyolefin fibers, polyvinyl fibers, polyurethane fibers or silk fibers. Suitable glues are, in particular, rubber-based, solvent-based, thermoplastically curable or pressure-curable glues. In addition to the substrate materials, adhesives are also, in particular, glass-fiber-reinforced 2d92ce491b
