

Shows how to use fuzzy logic, including the fuzzy overlay tool and the fuzzy membership tool, as well as how to use .motion and .predictive. In this tutorial, you'll learn how to create an app that doesn't use a template, but uses tracks. This is a simple example of a face application like the one you saw in this tutorial. The usefulness of this approach is that the application always works with the face and does not require a separate process to determine its face, since the face is always present at the destination, and the applications that work with them are combined into one program. The point is to make it clear that every app is based on a playlist, and using track motion, the app can understand what facial movement would look like in a particular instance. We'll show you how to build a lens application that is layered. Learn who has experience in processing faces. For those who don't, it's never too late to learn.
