The aim of this work was to evaluate the role of cold-shock proteins in lactococcal response to oxygen deprivation. For that purpose, Lactococcus lactis subsp. cremoris ssp. cremoris MG1363 and ssp. lactis MG1362 strain were grown and subjected to the following conditions: (i) anoxia or (ii) aerobic conditions at pH 7.0 or at pH 5.5, at 25°C or 10°C. Analysis of the total bacterial proteome by 2D gel electrophoresis, coupled with silver staining and mass spectrometry, allowed identification of 46 cold-shock proteins, of which 8 were specifically induced by oxygen deprivation. While proteins of the Hsp26-DnaK chaperone family were induced in both strains, most cold-shock proteins of L. lactis ssp. cremoris were highly induced and remained over-expressed during oxygen deprivation. This study provides new insights on the role of cold-shock proteins in lactococcal adaptation to oxygen deprivation and, notably, highlights the relative importance of this protein family in cold adaptation of this Gram-positive bacterium.Dear Panda, I Love Your Cover Up Collection, but I can't say I didn't know that your collection, 'Cover

The power amplification device includes a rotation transmission mechanism for transmitting rotation of the acceleration pedal to an input shaft of a rotation drive motor, a planetary gear mechanism disposed between the rotation transmission mechanism and the input shaft of the rotation drive motor, an output gear mechanism which is disposed coaxially with the rotation drive motor, and a power transmission mechanism connecting the output gear mechanism and a wheel drive unit. The power transmission mechanism transmits rotation of the wheel drive unit to the output gear mechanism via the power transmission unit. According to the power amplification device of the applicant of the present application, the rotation of the acceleration pedal is transmitted from the rotation transmission mechanism to the wheel drive unit via the rotation drive motor, the planetary gear mechanism, and the power transmission mechanism. Because the wheel drive unit is turned, the vehicle is accelerated by a rotational drive force of the rotation drive motor. Further, when the vehicle in a non-driving state moves, an electric motor is driven in the opposite direction to a turning direction of the wheel drive unit to generate a regenerative drive force of the electric motor, which is added to the rotational drive force of the wheel drive unit to increase an overall turning force of the wheel drive unit.Makina Station is a railway station on the Tōhoku Main Line in the town of b7e8fdf5c8
